

Abstract of the Disclosure

2 A positioning device for a miniature fan includes a
3 coil seat including a number of annularly spaced poles each
4 having a stem and an arcuate section. Each stem has a winding
5 wound therearound, and each arcuate section has a first end
6 edge and a second end edge. A circuit board is securely
7 connected to the coil seat and includes a sensor element
8 mounted thereon. The sensor element is located on a vertical
9 line extending from one of the first end edge and the second
10 end edge of one of the poles.
